

TRADESHOW BOOTHS AND MURALS

How Should Bleed And Tiling Be Set Up For A Tradeshow Booth?

Panel sizes are critical. If you are purchasing the booth from DGI-Invisuials, LLC obtain the dimensions of the panels from your Sales Representative or Sales Support Representative. Always add 1/4" of bleed around the outside of the layout. Add crop marks to where the panel breaks fall, *see figure 6*. If you have a booth and need help with sizing, contact your Sales Representative and they can assist you in measuring accurately. We always require the booth be provided to our finishing department for final fitting of graphics.

Should I Tile My Image?

No, we request that you do not tile your files, rather leave your image in one layout. Add 3" of bleed all around it if it is a wall mural or 1/4" of bleed if it is for a tradeshow booth. Our system is set up to automatically create the necessary overlap needed for panel matching and seam matching on installation.
